

User manual:

- You may access <http://chithanh.me> for a working website. This time I use Digital Ocean droplet to host the website, as you suggested. Good news is that it will be available all the time.
- The index will display all the tasks in your to-do list sorted by the due date and time.
- The page support basic CRUD on the task, as well as a search function to search for tags.

Personal experience: Personally I feel Ruby on Rails is less complicated and confusing than Drupal. By following the tutorial I can build the to-do app from scratch, unlike in assignment 2 I just modify the HelloWorld module. This helps me to gain a better understanding on how it works. However, we have to add the styling separately. I also learn how to remotely control and setup a Linux server. I use ssh to access, install Ruby on Rails on the server, then clone my website to the server. Finally tell the domain to forward to the server ip address. After the assignment I understand better about the web, specifically about Ruby on Rails and web server.
